Chapter 1 - System Information

1.1 About this manual

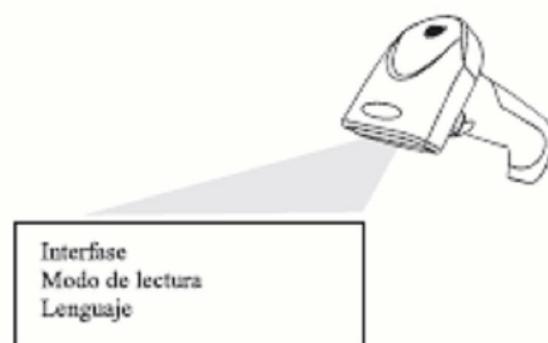

This User's Guide provides detailed programming instructions. Barcode scanners are factory programmed for the most common communication setting. If you need to change these settings, programming is accomplished by scanning the bar codes in this guide.

1.2 How to set up the parameter

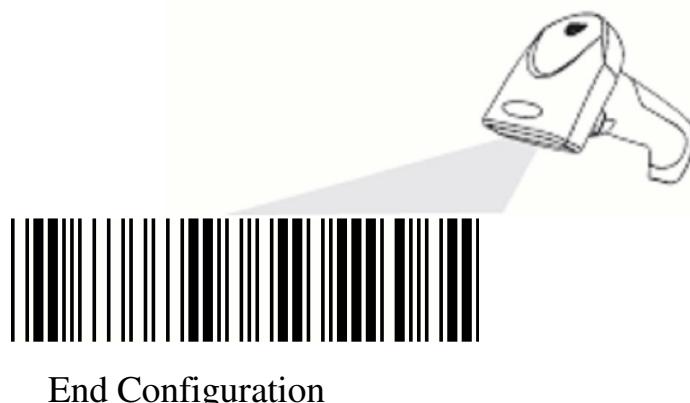

Step 1: Scan the start configuration barcode

Step 2: Scan necessary label for parameters that meet your application

Step 3: Scan end configuration to save the changes

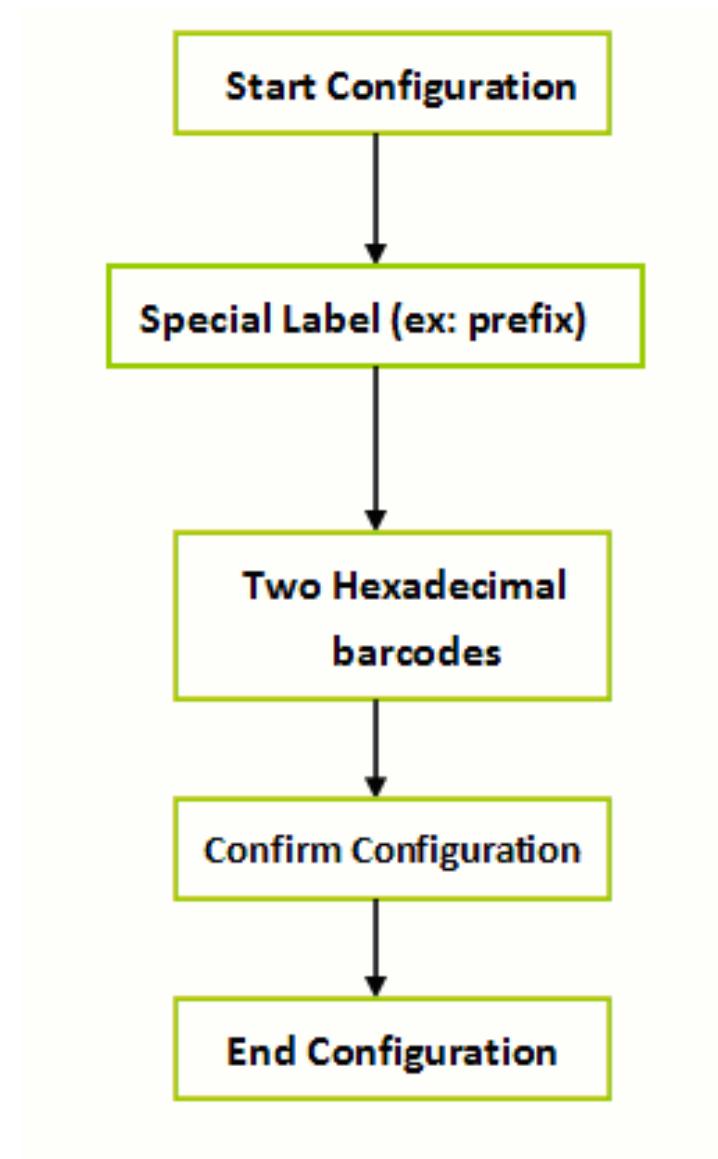

1.3 How to set up the parameter – II

Most of time the scanner only requests one read of parameters when changing to new values. You will hear two beeps when you successfully set to the new values. But for some special parameters, multiple reads are needed to complete the configuration. When use these special parameters. In some cases, you might need to read one or more barcodes, such as:

Hexadecimal barcodes. For example: prefix, suffix, etc.

Numeric barcodes. For example: inter-character delay, max/min length

To complete the change of setting you will need to read the “Confirm” bar code after you read the parameter. Below is the flow chart to explain two different configurations.

1.4 Resetting the standard product default

If you aren't sure what programming options are in your scanner, or you've changed some options and want the factory settings restored, scan the Standard Product Default Settings bar code below.

Standard Product Defaults Setting

Chapter 2 - System setup

2.1 Interface selection

The scanner is designed to switch easily from interfaces.

Remember to reset the interface before changing to PS/2 or RS232 cable. No presetting is required for USB interface. Scanning USB barcode after the cable is changed and activating the scanner by plugging the USB cable again. USB interface complies with HID keyboard which means the setting of USB scanner is exactly the same like the default setting from keyboard.

2.4 String Options (Prefix & Suffix)

This section describes the alterations which can be made to the format of the transmitted data string. A prefix and suffix of maximum 10 direct input may be included in front and at the end of scanned barcode.

Format

{Prefix} {Code ID} {Bar Code} {Suffix}

How to set up a prefix?

To configure “##” as prefix

- (1) Scan Start Configuration barcode
- (2) Scan Preamble bar code
- (3) Scan ‘#’ twice from FULL ASCII table
- (4) Scan Confirm configuration barcode
- (5) Scan End Configuration barcode.

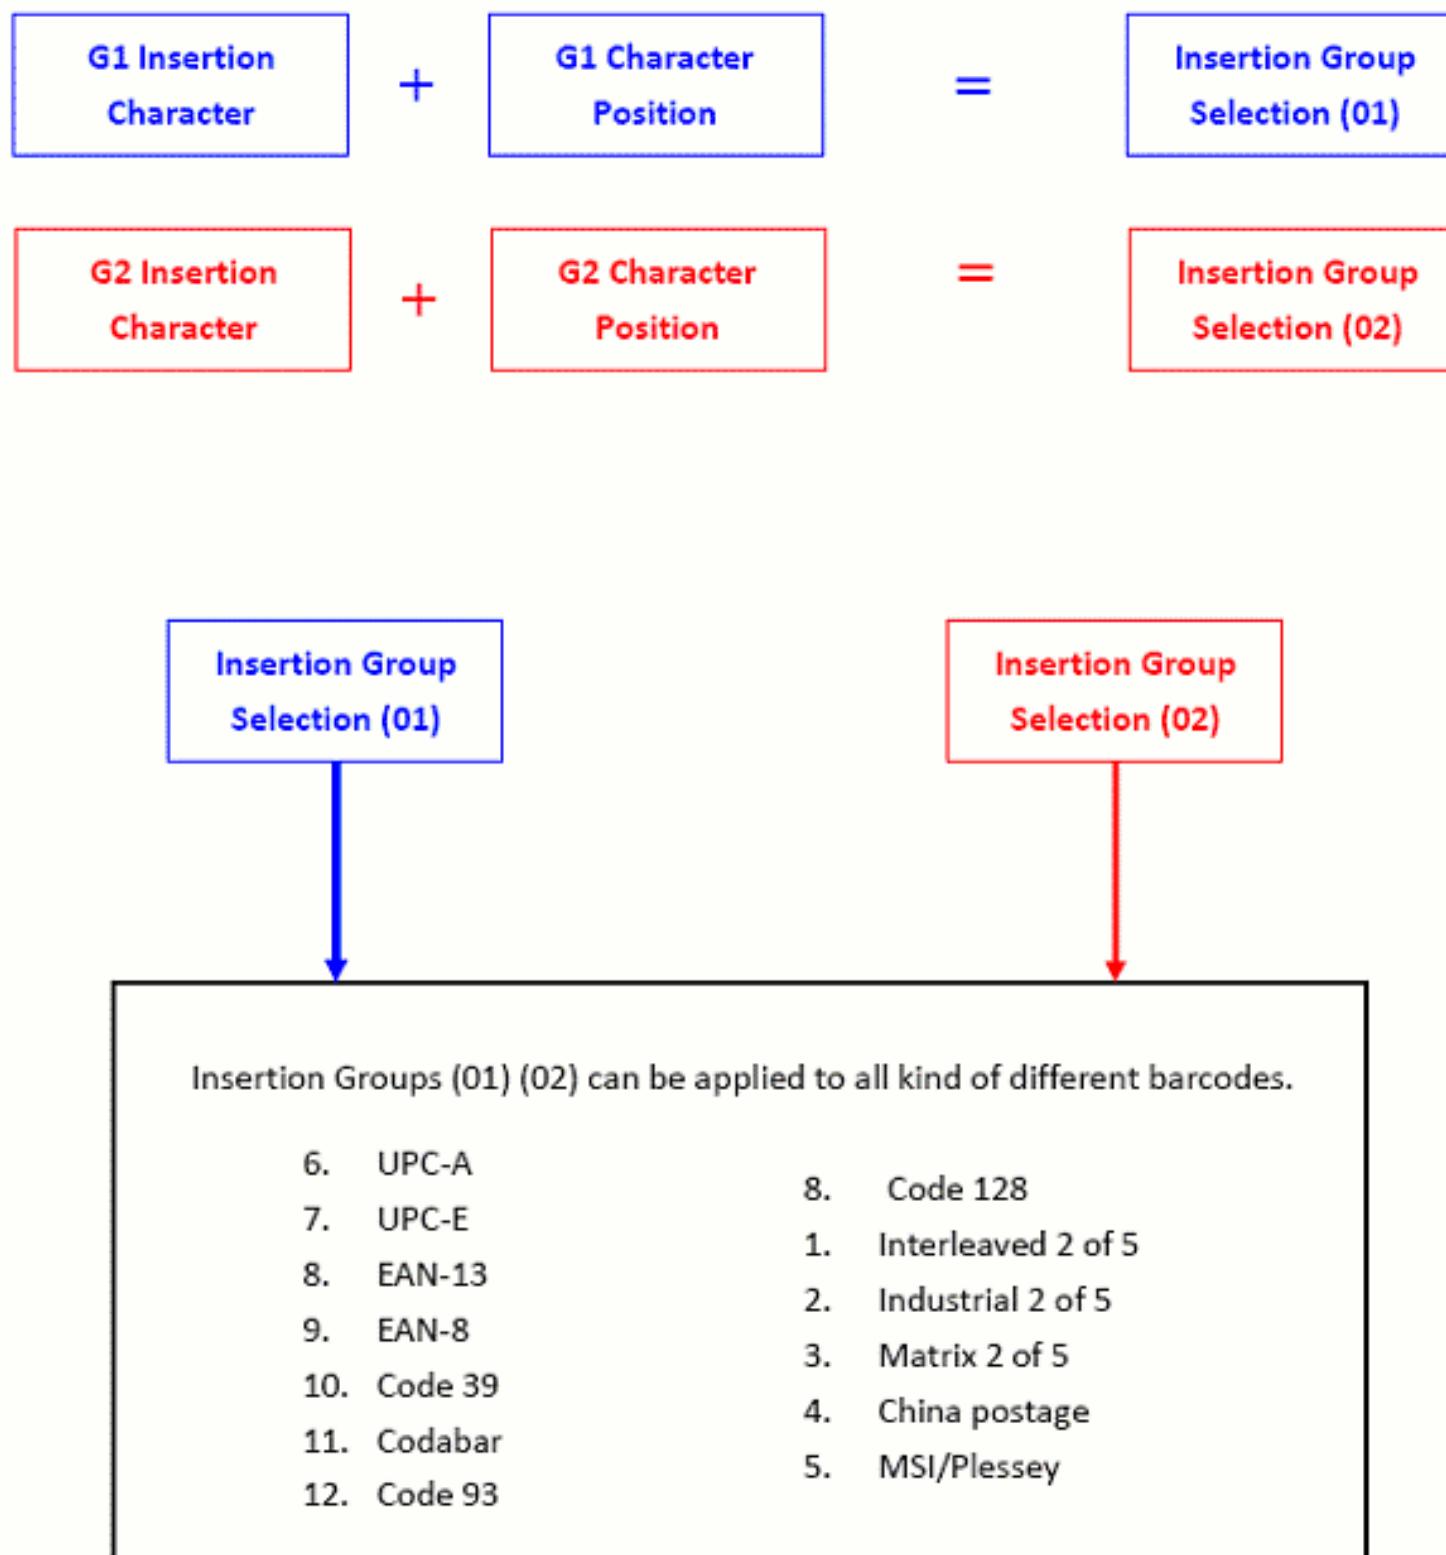

How to set up a suffix?

To configure “\$\$” as suffix

- (1) Start configuration barcode
- (2) Scan Postamble barcode
- (3) Scan ‘\$’ twice from FULL ASCII table
- (4) Scan Confirm configuration barcode
- (5) Scan End configuration bar code.

2.5 Setup Insertion

This section describes how to setup the insertion of output.

NOTE :

Max. 10 characters can be inserted each time

Max. Insertion group is only two.

Insertion group (01) or (02) can be used in different kinds of barcodes at the same time

Example:

:

To insert character “A” before the third digit(3)

Make the decoded data: 12 A3456789

How to set up a character you want to insert

- (1) Scan Start Configuration barcode
- (2) Scan “G1 Insertion character”
- (3) Scan “4” and “1” from FULL ASCII Table
- (4) Scan Confirm configuration barcode
- (5) Scan End configuration barcode

How to set up position you wish to place the character

- (6) Scan Start Configuration barcode
- (7) Scan “G1 Character Position”
- (8) Scan “0” and “3” from FULL ASCII Table (which presents the position)
- (9) Scan Confirm configuration barcode
- (10) Scan End configuration barcode

How to set up insertion for code 39

Go to chapter 3.5 (code 39)

- (11) Scan Start Configuration barcode
- (12) Scan “Insert group selection” bar code
- (13) scan “0” and “1” from FULL ASCII Table
(which presents the group- 01 you just set up previously)
- (14) Scan Confirm configuration bar code
- (15) Scan End configuration barcode

Start configuration

End configuration

Confirm configuration
